# Office Action Summary

Application No.

10/633,658

Applicant(s)

SATO, HIDEO

Examiner

Roderick Tolentino

Art Unit

2134

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 21 May 2007.
- 2a) ☒ This action is FINAL. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 05 August 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_.

### **DETAILED ACTION**

1. Claims 1 – 20 are pending.

#### ***Response to Arguments***

2. Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection, as necessitated by amendment made by applicant on 05/21/2007.
3. With regards to 35 U.S.C. 101 rejections and 35 U.S.C. 112 1<sup>st</sup> paragraph rejections, arguments and amendments have been deemed persuasive and the rejections have been withdrawn.

#### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically teachd or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1, 2, 5, 6, 9, 11, 13, 14, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378) in view of Dyer et al. U.S Patent No. (6,625,592).
6. As per claims 1 and 13, Garib teaches a public key encryption processing means for performing an encryption operation using a public key encryption technique to

Art Unit: 2134

generate encrypted data (Garib, Col. 15 Lines 14 – 17, encrypting an unencrypted message using public key), hash value generation means for generating a hash value which is used by the public key encryption processing means and storage means for storing the hash value, (Garib, Col. 5 Lines 66 – 67 and Col. 6 Lines 1 – 6, generates a hash and stores the hash), but fails to teach control means for controlling the hash value generation means and the public key encryption processing means, the control means suppressing arithmetic operations performed by the public key encryption processing means when the hash value generation means accesses the storage means. However, in an analogous art Dyer teaches control means for controlling the hash value generation means and the public key encryption processing means, the control means suppressing arithmetic operations performed by the public key encryption processing means when the hash value generation means accesses the storage means (Dyer, Col. 5 Lines 14 – 20 and Col. 2 Lines 7 – 21).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use Dyer's system for hash scanning of shared memory interfaces with Garib's secret key messaging because it offers the advantage of being faster to traverse the hash memory (Dyer, Col. 2 Lines 7 – 21).

7. As per claims 2 and 14, Garib teaches the public key encryption processing means includes a register group having a register for maintaining an arithmetic operation value and a register for storing a result, the hash value generation means includes a register group having a register for maintaining an arithmetic operation value and a register for storing the generated hash value, at least the register group of the

Art Unit: 2134

public key encryption processing means and the register group of the hash value generation means are shared (Garib, Col. 4 Lines 9 – 26 and Col. 12 Lines 16 – 19, Garib teaches a comparison and the use of a processor, It is inherent that a processor uses registers to perform tasks that involve comparing values) and the hardware is switched in a time-shared manner depending upon the operation mode (Garib, Col. 12 Lines 16 – 19, It is inherent that a processor operates in a time shared manner).

8. As per claims 5 and 17, Garib teaches the public key encryption processing means includes public key encryption arithmetic operation core means for performing various arithmetic operations for public key encryption (Garib, Col. 4 Lines 38 – 42, IDEA is an arithmetic key generation means), the hash value generation means includes hash value arithmetic operation core means for performing various arithmetic operations for hash value generation (Garib, Col. 4 Lines 9 – 26, SHA-1 used for Hash generation which is an arithmetic means for hash generation), and the public key encryption arithmetic operation core means and the hash value arithmetic operation core means are shared (Garib, Col. 4 Lines 62 – 67, Hash and key are used together).

9. As per claims 6 and 18, Garib teaches the public key encryption arithmetic operation core includes adder means, and shares the adder means with the hash value arithmetic operation core means (Garib, Col. 4 Lines 9 – 26 and Col. 12 Lines 16 – 19, Garib teaches a comparison and the use of a processor, It is inherent that a processor uses adders to perform operations).

10. As per claim 9, Garib teaches the hash value generation means stores the generated hash value into the storage means at an address which is used by the public

Art Unit: 2134

key encryption processing means, and the public key encryption processing means reads the hash value stored in the storage means (Garib, Col. 5 Lines 66 – 67 and Col. 6 Lines 1 – 6, generates a hash and stores the hash, addresses would be inherent).

11. As per claim 11, Garib teaches the hash value generation means performs an operation using the SHA-1 technique (Garib, Col. 4 Lines 9 – 26, SHA-1 used for Hash generation).

12. Claims 3, 4, 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378) and Dyer et al. U.S Patent No. (6,625,592) and in further view of Kaufman et al. U.S. Patent No. (5,764,772).

13. As per claims 3 and 15, Garib teaches the common key encryption processing means including a register group having a register for maintaining the resulting data and a register for maintaining key data, wherein the register group of the common key encryption processing means and the register group of the public key encryption processing means are shared (Garib, Col. 4 Lines 9 – 26 and Col. 12 Lines 16 – 19, Garib teaches a comparison and the use of a processor, It is inherent that a processor uses registers to perform tasks that involve comparing values) but fails to teaches common key encryption processing means for performing an encryption operation using a common key encryption technique to generate a random number for use in the encryption operation of the public key encryption processing means. However, in an analogous art Kaufman teaches common key encryption processing means for performing an encryption operation using a common key encryption technique to

Art Unit: 2134

generate a random number for use in the encryption operation of the public key encryption processing means (Kaufman Col. 4 Lines 26 – 34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use Kaufman's differential work factor cryptography with Garib's secret key messaging because it offers the advantage of creating a key based on an unpredictable number which makes the key more secure (Kaufman Col. 4 Lines 26 – 34).

14. As per claims 4 and 16, Garib as modified teaches the common key encryption processing means performs the encryption operation using the DES technique (Kaufman, Col. 1 Lines 38 – 44).

15. Claims 7 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378) and Dyer et al. U.S Patent No. (6,625,592) and in further view of Kitamura U.S. PG-Publication No. (2002/0016917).

16. As per claims 7 and 19, Garib fails to teach the public key encryption processing means includes a bus switch for making the bit width variable, and the public key encryption processing means shares the bus switch with the hash value generation means. However, in an analogous art Kitamura teaches the public key encryption processing means includes a bus switch for making the bit width variable, and the public key encryption processing means shares the bus switch with the hash value generation means (Kitamura, Paragraph 0085).

Art Unit: 2134

At the time the invention was made it, it would have been obvious to a person of ordinary skill in the art to use Kitamura's system integrated circuit with Garib's secret key messaging because it offers the advantage of high speed switching in a system.

17. Claims 8 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378), Dyer et al. U.S Patent No. (6,625,592) and Kitamura U.S. PG-Publication No. (2002/0016917), as applied to claim 7 and in further view of Kaufman et al. U.S. Patent No. (5,764,772).

18. As per claims 8 and 20, Kitamura teaches, the common key encryption processing means including a bus switch, wherein the bus switch of the common key encryption processing means and the bus switch of the public key encryption processing means are shared (Kitamura, Paragraph 0085), but fails to teach further comprising common key encryption processing means for performing an encryption operation using a common key encryption technique to generate a random number for use in the encryption operation of the public key encryption processing means. However, in an analogous art Kaufman teaches further comprising common key encryption processing means for performing an encryption operation using a common key encryption technique to generate a random number for use in the encryption operation of the public key encryption processing means (Kaufman Col. 4 Lines 26 – 34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use Kaufman's differential work factor cryptography with

Art Unit: 2134

Garib's secret key messaging because it offers the advantage of creating a key based on an unpredictable number which makes the key more secure (Kaufman Col. 4 Lines 26 – 34).

19. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378) and Dyer et al. U.S Patent No. (6,625,592) and in further view of Schneier, Applied Cryptography 2<sup>nd</sup> Edition.

20. As per claim 10, Garib fails to teach the public key encryption processing means performs the encryption operation using the elliptic curve cryptosystem technique. However, in an analogous art Schneier teaches the public key encryption processing means performs the encryption operation using the elliptic curve cryptosystem technique (Schneier, Page 480, section 19.8).

At the time the invention was made, it would have been obvious to a person ordinary skill in the art to use Schneier's Applied Cryptography with Garib's secret key messaging because it offers the advantage of smaller key-sizes to create faster systems (Schneier, Page 480, section 19.8).

21. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Garib U.S. Patent No. (6,728,378) and Dyer et al. U.S Patent No. (6,625,592) and in further view of Inada U.S. Patent No. (6,986,044).

22. As per claim 12, Garib fails to teach the encryption apparatus is incorporated in a non-contact IC card having a communication function. However, in an analogous art

Art Unit: 2134

Inada teaches the encryption apparatus is incorporated in a non-contact IC card having a communication function (Inada, Col. 9 Lines 10 – 20).

At the time the invention was made it would have been obvious to a person of ordinary skill in the art to use Inada's method for group unit encryption with Garib's secret key messaging because it offers the advantage of having a secure storage for encryption keys (Inada, Col. 9 Lines 10 – 20).

### ***Conclusion***

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
